

ProductionManagementAI — Product master impact on existing screens — Basic Design Addendum (基本設計追補)

Document control

Field	Value
Document ID	004_BD-EXISTING-SCREENS
Work item	WI-006
Version	1 — Product master impact on SCR-001–SCR-003
Created / updated	Codex, 2026-09-29
Source of truth	WI-006 brief , decisions DEC-003–DEC-004 and DEC-007–DEC-011, 004 BD version 2
Approved baselines extended	001 BD (WI-002), 002 BD (WI-003), 003 BD (WI-004); those files and their PDFs remain unchanged

Purpose and requirement coverage

This new WI-006 document describes the **delta** to the approved production-order and dashboard designs when products have active state and units. It does not supersede the baseline documents. Existing order status transitions, due-date rules, route names, list filters/paging, plant-time windows, health behavior, and read-only dashboard posture remain as their approved baselines specify. Exact API, persistence, message IDs and interaction details belong to later WI-006 DB/DD documents.

Requirement	Added design coverage
REQ-052, REQ-056	Retired product is historical/readable; an old order may retain it unchanged, but no new selection may use it
REQ-057	Referenced product unit remains fixed so historical quantities keep their meaning
REQ-058	Positive <code>kg / m</code> order quantities allow up to three fractional digits; discrete units remain whole numbers; all remain at most 999,999,999
REQ-059	SCR-001 and SCR-002 show the quantity's product unit
REQ-060	SCR-003 never sums different units; cross-unit figures and rankings use order counts

Shared flow and screen transition

The shared navbar gains 「製品マスタ」 (Product master), pointing to SCR-004. Existing routes and the SCR-001/SCR-002 transition remain. Dashboard widgets remain read-only and do not link to orders. An expired session still exits to `/login` . Product retirement changes choice eligibility and displayed data, not navigation.

Screen / mode	Entry	Exit and unchanged route behavior
SCR-001 create/edit	Shared navbar's 「新規製造指示」 (New production order), SCR-002 Add/row, or a direct edit route	Create Save → edit route; edit Save → stays; Cancel → SCR-002; shared navbar → its destination; 401 → <code>/login</code>
SCR-002 list	Shared navbar, SCR-001 Cancel, or direct list URL	Add/row → SCR-001; shared navbar → its destination; 401 → <code>/login</code>
SCR-003 dashboard	Login landing page <code>/</code> or shared navbar	Shared navbar → its destination; 401 → <code>/login</code> ; widgets have no route exit
SCR-004 Product master	Shared navbar's new 「製品マスタ」 entry	The Product master modes and exits are in 004 BD

The old Draft → InProgress/Cancelled → Completed status rules remain in [001_BD](#). Product and quantity stay locked once an order leaves Draft. The Product master screens use their own transition diagram in 004_BD.

SCR-001 — Production order create/edit impact

Business and exception flows

1. On create, load product choices with active state and unit. Only active products can be chosen. Until a product is selected, quantity displays no unit and prompts for a product first.
2. On edit, load the order's saved product even if it is retired. If Draft, that saved retired product remains a visible, marked choice and can be retained for an unrelated edit. Choosing another product is allowed only if the new one is active. If the order is no longer Draft, product and quantity stay read-only as

before, including a retired saved product.

3. Show the selected product's unit next to 「数量」 (Quantity). For **kg** or **m**, accept a positive value with at most three fractional digits; for **個**, **本**, **枚**, **台**, or **セット**, accept a positive integer. Apply the existing 999,999,999 upper bound to both. Revalidate when product selection changes; a fractional value cannot be saved after switching to a discrete unit. Show the saved decimal without rounding away meaningful digits.
4. Save keeps the baseline success routes. The server repeats unit-specific validation and rejects a newly selected retired product. A race with retirement results in an actionable error; no invalid order is committed. A Draft edit retaining its unchanged retired product remains savable when other fields are valid.

State	Visible behavior
No product selected	Quantity has no implied 個 default; unit help asks the user to select a product
Active discrete product	Unit shown; whole-number rule explained and validated
Active kg or m product	Unit shown; decimal precision of at most three places explained and validated
Saved retired product on old Draft order	Product remains selected with 「使用停止」 (Retired); saving with that original product ID is allowed, while a different retired product ID is rejected
Product/quantity locked by status	Saved product, unit and quantity remain readable; no new selection or quantity edit
Product list or order load failure	Existing error/retry behavior; never silently replace a missing product with another choice
Unit-specific validation or retirement conflict	Error associated with the field and summary; form values remain for correction

No.	Region	New or changed behavior
1	Shared navbar	Adds Product master entry; existing current-page, unsaved-change guard and SP Menu behavior stay
2	Product field	Active choices; selected retired historical product is explicitly marked in edit mode
3	Quantity field	Unit beside label/value; integer or decimal help and errors depend on selected unit
4	Error/status area	Announces unit validation or retired-product conflict and keeps typed values

SCR-002 — Production order list impact

The product filter still contains **all** products, including retired ones, so historical orders remain findable. A retired filter option is marked 「使用停止」 (Retired). Each row pairs its quantity with the product's unit, including decimal values for **kg** and **m**; PC and SP preserve the existing order number, due date, status, updated time, search, paging and navigation. The existing **quantity** sort remains numeric by stored value; its displayed unit prevents the result from being mistaken for a common physical measure. No quantity total is added to the result summary.

State	Visible behavior
Retired product filter selected	Historical matching orders are returned; the filter remains selected in the URL
Row uses retired product	Product identity and unit remain readable; the row still opens SCR-001
Empty, loading, failed query	Baseline states remain; no placeholder unit such as 個 is fabricated
Missing product/unit after migration	Show the baseline recoverable error state and log an integrity failure; do not show a unitless quantity as valid data

数量順 前へ 次へ

No.	Region	New or changed behavior
5	Product filter	Includes retired products with text marker
6	Quantity column/card line	Shows each row's own unit, including decimal measured quantities
7	Result summary/sort	Continues to show order count; numeric quantity sort does not assert a cross-unit total

SCR-003 — Dashboard impact

The dashboard still reads one consistent snapshot, uses the existing plant-local time windows, preserves order-count status/attention/trend metrics, and stays read-only. The old quantity suffix 個 is removed from mixed-product totals. A quantity appears only with its product's unit or in a breakdown keyed by unit.

Baseline widget / metric	WI-006 meaning and label	Reason
Status tiles and attention group counts (D-01, D-02)	Keep 「件」 (orders); attention rows show quantity + unit	Counts remain comparable; each row has its own unit
Open workload by due week (D-03)	Rename to 「納期週別の未完了製造指示件数」 (Open order count by due week); chart bar height and labels are order counts. The accessible table also shows per-unit quantity subtotals, each headed by its unit; no mixed-unit subtotal	Each active order still belongs to exactly one existing due-date bucket
Top products (D-04)	Rename to 「未完了製造指示の多い製品」 (Products with most open orders); rank by active order count descending, then SKU ascending. Show each product's open quantity with that product's unit as secondary information	A single cross-unit quantity ranking is invalid; one product has one fixed unit once ordered
Completed this week/month (D-05, D-06)	Show the order count and time window; remove the formerly aggregated 個 quantity line	The tile spans multiple product units
On-time rate, completion trend, lead time (D-07–D-09)	Preserve percentage, order-count and elapsed-day meanings	These metrics do not aggregate unlike units

The workload's ten buckets and the trend's twelve buckets remain the baseline periods. Workload bars sum to the active-order count (Draft + InProgress). Top products exclude products with zero active orders. Equal counts use SKU order for stable ranking. A product's quantity subtotal is internally homogeneous because its unit cannot change after the first order references it (REQ-057). Per-unit breakdowns use the seven approved unit labels and omit empty units; kg and m show up to three fractional digits. Exact response fields and aggregation query belong to WI-006 DD/API/DB.

State	Visible behavior
Zero active orders	Existing empty messages; workload and top products show no fabricated quantity/unit
Zero recent completions	On-time and lead-time placeholders remain as approved; completed tiles show 0件 only
Mixed units in a workload bucket	One count bar; accessible table shows any per-unit subtotals separately
Snapshot/API failure	Existing retry/error state; never reuse stale totals as current data
Maximized chart or SP layout	Existing modal and keyboard behavior; count labels and per-unit table remain available

3. P-2001 3件 6.375 kg

The wireframe figures are illustrative; **P-2001** is an example of a newly registered **kg** product, not one of the 30 seeded parts.

004_BD-EXISTING-SCREENS version 1 (2026-09-29)

12 / 13

No.	Region	New or changed behavior
8	Delivery tiles	Completed this week/month show order counts without mixed-unit quantity
9	Attention rows	Quantity carries each row's product unit
10	Workload chart/table	Bars show order counts; table can show subtotals by unit
11	Top products	Ranked by open order count; each product quantity labelled with its unit

Data, security and accessibility implications

- **Data:** Order quantity becomes a positive decimal-capable value, but migrated whole-number history retains its value. Product ID/FK and prior order statuses remain. A referenced product's unit cannot change; retired products and their identity remain readable. Schema/migration details belong to WI-006 DB documents.
- **Authorization:** Existing SCR-001–SCR-003 `Admin / Operator` server checks and same-origin cookie posture remain. No new PII or secret is introduced. Product master write permission is separately specified in 004_BD. No order or dashboard client control can bypass server-side product eligibility or quantity checks.
- **Accessibility:** Unit is visible text associated with each quantity, not color or an unlabeled suffix. Changing product announces the new unit/rule; an invalid amount is linked to its field and focus moves to the first error. Retired choices have text markers. Dashboard charts keep accessible names, visible values and equivalent tables; responsive layouts do not require horizontal page scrolling. WCAG 2.2 AA remains the target.
- **Observability:** A rejected retired selection or unit-specific quantity is a validation outcome, without logging product name or full request body. Dashboard snapshot failures retain the existing failure signal; new count/per-unit aggregations are traced in WI-006 DD-FN.

Open design handoff

No further business decision is required for this BD: the cross-unit rule is DEC-007 and decimal/unit-lock rules are DEC-008–DEC-010. WI-006 DB and DD documents will resolve exact storage, API fields, concurrency, messages, sorting implementation, and formatting. Those details must match this screen-level behavior before application implementation.
